²Max-Planck-Institute for Solid State Research, Stuttgart, Germany

Please write here the abstract of your contribution. It should be written in LaTeX style allowing us to deal easier with all these abstracts.

You can include formulas in the lines, like $R_{\text{Hall}} = h/(\nu e^2)$, or in separate lines

$$R_{\text{Hall}} = \frac{h}{\nu e^2}, \quad (1)$$

which can be referred to by (1).

Furthermore, you can use the conventional LaTeX format for citing, – for instance, the work [1] or other publications [2]. The respective reference list is found at the bottom.

If required, eps-figures can be included.¹ An example for doing this is shown in the following. Please note, the loading of the eps-file is deactivated here by beginning the respective line ‘\includegraphics’ with %.

In this part, you can continue with one or more paragraphs of your abstract text. The text width has to be adapted to the desired figure width by adjusting both minipage widths. This ‘two-column’ format is proposed allowing you to present more text.

Figure 1: Your figure.

Please note, your whole abstract should not exceed this page. However, do not change the page width or height, or the font size. For getting a print, run ‘frame.tex’ with LaTeX which will incorporate this file if stored in the same directory under the name ‘abstract.tex’.

If you have problems, please contact us via the symposium email address. If you cannot deal with LaTeX and, therefore, it is impossible for you handling this template, you can send your abstract by email in ASCII-format, as Microsoft Word file (.doc) or as a pdf-file.
